11 Skewness and kurtosis: relation between Cain et al. (2017) and the package ‘PearsonDS’

12 In 2017, Cain et al. have conducted a review assessing the skweness and kurtosis of
 13 articles in recent psychology and education publications. They used the following formulas of
 14 Fisher’s skewness (G_1) and kurtosis (G_2):

$$G_1 = \frac{\sqrt{n(n-1)}}{n-2} \frac{m_3}{\sqrt{(m_2)^3}} \quad (1)$$

15 With s = standard deviation, n = sample size and m_3 =third centered moment.

$$G_2 = \frac{n-1}{(n-2)(n-3)} \times [(n+1)(\frac{m_4}{(m_2)^2} - 3) + 6] \quad (2)$$

16 With s = standard deviation, n = sample size and m_3 =third centered moment.

17 I chose to use this article in order to define which value of skewness and kurtosis I
 18 would simulate, in order to test the goodness of different measures of effect sizes under
 19 realistic population parameter values. In my simulations, I Chose the function “rPearson”
 20 from the package “PearsonDS”, in which skewness and kurtosis are computed as following:

$$skewness = \frac{m_3}{\sqrt{(m_2)^3}} \quad (3)$$

$$kurtosis = \frac{m_4}{(m_2)^2} \quad (4)$$

21 In order to simulate a sample extracted from a population where $G_1 = X$, using the
 22 “rPearson” function, I need to make the following transformation:

$$\frac{\sqrt{n(n-1)}}{n-2} \frac{m_3}{\sqrt{(m_2)^3}} = X \iff \frac{m_3}{\sqrt{(m_2)^3}} = \frac{X(n-2)}{\sqrt{n(n-1)}} \quad (5)$$

²³ In order to simulate a sample extracted from a population where $G_2 = X$, using the
²⁴ “rPearson” function, I need to make the following transformation:

$$\frac{n-1}{(n-2)(n-3)} [(n+1)(\frac{m_4}{(m_2)^2} - 3) + 6] = X \iff \frac{m_4}{(m_2)^2} = \frac{X(n-2)(n-3) - 6(n-1)}{n^2 - 1} + 3 \quad (6)$$
